

Resolve Conform Station™

da Vinci's Conform Station was designed to be used as a prep station for DI color correction sessions, taking housekeeping tasks out of the expensive color grading suite. The Conform Station is economical and scalable for future enhancements, including an option for use as an assistant station. Busy facilities benefit when the Conform Station is utilized in this way. Tasks such as ingest, conform and formatting are done at a fully parallel offline station, freeing up the colorist and Resolve® grading suite for their most important task – color grading. Simply said, this translates into improved operational efficiency and reduced costs.

BASIC FUNCTIONS:

- Set session options/environment
- Build media pool
- Parse previously conformed material with EDL, or scene detect without an EDL
- Conform EDL if available, edit or create timeline if necessary with drag and drop editing capability
- Handle conforming conflicts, ColorTrace™ new EDLs
- Load an offline clip from storage and compare to conform
- Quality-check the ingested material using waveform monitor, vectorscope parade and picture displays on GUI monitor

The Conform Station prepares sessions for grading and saves them to a shared Resolve data base. Conform Station works in parallel with Resolve as new shots come in. Workflow is streamlined, and sessions are set up when the client arrives, maximizing the colorist's time with the customer.

HIGH SPEED PROXY OPTION

When facilitating high speed proxy operation, the Conform Station is very useful for facilities choosing to implement a multi-layer storage solution – for example, CXFS™ SAN near-line storage and ADIC® Resolve local storage. For this use it is available with up to two Transformer boards for processing delivery-quality proxy images at very high speeds.

RESOLVE CONFORM STATION INTERFACE

OPTIONS:

- Video I/O for ingest and playout functions
- Transformer™ image processor board for delivery-quality proxy generation
- HD-SDI video card for broadcast monitor support

DUAL FILE SYSTEM SUPPORT

For proxy generation in a multiple file system facility, Conform Station reads from one CXFS file system – likely 4K resolution files – and writes proxies to ADIC storage at 2K resolution. The facility SAN remains to function as near-line storage while Resolve works from dedicated local storage, freeing SAN bandwidth for use by other workstations.

da Vinci is continually striving to improve our products, therefore specifications are subject to change without notice.
